Oct 04, 2018

Good day,

I study under Tennessee Tech's computer science program. My concentration is software applications wherein my interests span Web and Mobile development. I have built many basic web applications in pursuit of mastery. I pursue a Bachelor's degree as part of my commitment to writing professional software. Today, I am exploring the Career Fair to share my passion for software while seeking out opportunities for the Summer.

Most of my programming knowledge is self-taught. My techniques for programming have been refined through attending University. I provide work-service to Tennessee Tech's ITS department. I help teach introductory data structures alongside tutoring foundations of computer science. Campus meetings concerning computing machinery and competitive programming keep me occupied week after week. I can communicate clearly regardless of the audience.

My work experience is entry-level. I have completed internships both on and off my University's campus. I was capable and communicative during each internship. The approval of my managers and fellow team members came as result of getting things done and communicating what was not going so well. Recognizing my failures as lessons for continuous improvement has spurred my growth more than ever.

The last part of my resume concerns self-instruction. I started developing software after coming across Free Code Camp. This program introduced me to project-based development. Each development certification took ~400 hours to complete. Every hour was self-taught over the Internet without a teacher's guidance.

Thank you for your time and consideration,

John Simmons
